

### The State of the Poor: Where are the Poor and where are they Poorest?<sup>1</sup>

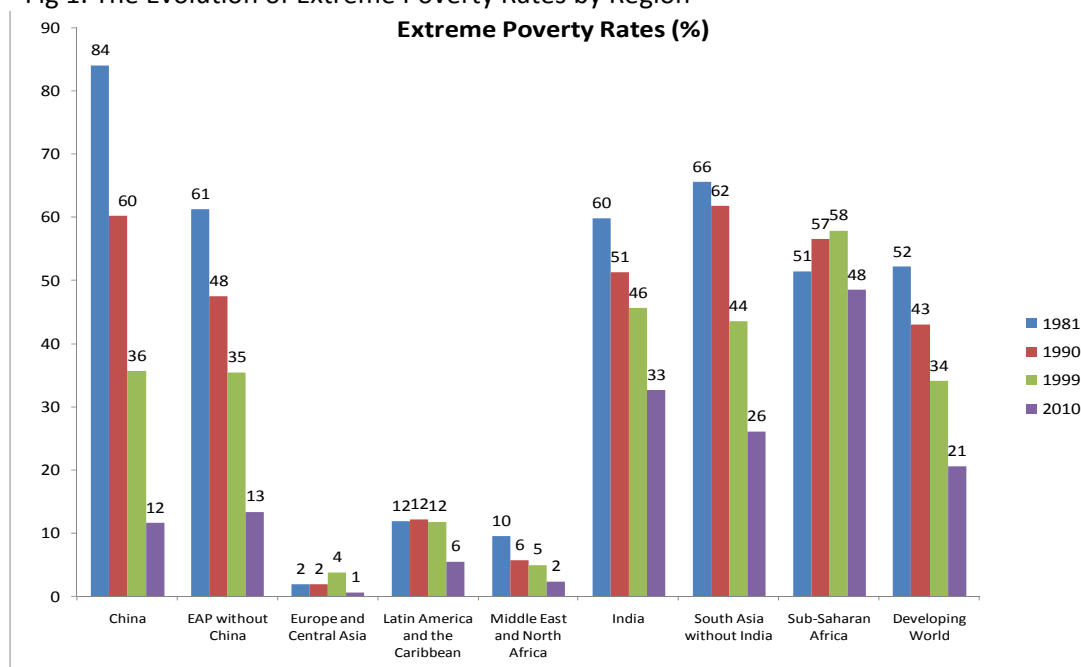

Extreme poverty in the world has decreased considerably in the past three decades (figure 1). In 1981, more than half of citizens in the developing world lived on less than \$1.25 a day. This rate has dropped dramatically to 21 percent in 2010. Moreover, despite a 59 percent increase in the developing world’s population, there were significantly fewer people living on less than \$1.25 a day in 2010 (1.2 billion) than there were three decades ago (1.9 billion). But 1.2 billion people living in extreme poverty is still a extremely high figure, so the task ahead of us remains herculean.

To accelerate poverty reduction and end extreme poverty by 2030, we need to know who are the poor, where do they live, and where poverty is deepest.

### How have the different regions of the developing world performed in terms of extreme poverty reduction?

Extreme poverty headcount rates have fallen in every developing region in the last three decades. And both Sub-Saharan Africa (SSA) and Latin America and the Caribbean (LAC) seem to have turned a corner entering the new millennium. After steadily increasing from 51 percent in 1981 to 58 percent in 1999, the extreme poverty rate fell 10 percentage points in SSA between 1999 and 2010 and is now at 48 percent—an impressive decline of 17 percent in one decade. In LAC, after remaining stable at approximately 12 percent for the last two decades of the 20<sup>th</sup> century, extreme poverty was cut in half between 1999 and 2010 and is now at 6 percent.

However, despite its falling poverty rates, Sub-Saharan Africa is the only region in the world for which the number of poor individuals has risen steadily and dramatically between 1981 and 2010 (figure 2). There were more than twice as many extremely poor people living in SSA in 2010 (414 million) than there were three decades ago (205 million).

As a result, while the extreme poor in SSA represented only 11 percent of the world's total in 1981, they now account for more than a third of the world's extreme poor (figure 3). India contributes another third (up from 22 percent in 1981) and China comes next contributing 13 percent (down from 43 percent in 1981).

### How poor are the extremely poor? Have they become poorer in the last three decades?

Figure 4 plots the average daily per capita income of the extremely poor in the developing world as a whole, in the Sub-Saharan Africa region, and in the developing world excluding Sub-Saharan Africa. As shown, the average income of the extremely poor in the developing world has been rising and steadily converging to the \$1.25 per day poverty line. In 2010, the average income of the extremely poor in the developing world was 87 cents per capita per day, up from 74 cents in 1981 (in 2005 US dollars). If the extreme poor in Sub-Saharan Africa were not included, the average income of the world's poor would have converged even faster to the \$1.25 line (figure 4).

**This increase in incomes of the extreme poor is unfortunately not seen in Sub-Saharan Africa. Between 1981 and 2010, the average income of the extremely poor has remained flat at approximately half of the \$1.25 line in that region.**

#### Where is extreme poverty deepest and therefore hardest to end?

Accelerating extreme poverty reduction is a huge challenge in both sub-Saharan Africa and South Asia, given that there are approximately 400 million and 500 million extreme poor people in these regions respectively. The depth of extreme poverty is commonly measured by the extreme poverty gap. When expressed in dollars based on Purchasing Power Parity (PPP) calculations, the extreme poverty gap represents the average amount of additional daily income needed by the extremely poor to reach the poverty line of \$1.25 per day. Thus, from figure 4, we can see that the average gap of the extremely poor in the world is 38 cents per day, or approximately \$140 per year in 2005 PPP dollars. Since there are 1.2 billion extremely poor individuals in the world, the aggregate global extreme poverty gap amounts to approximately \$169 billion dollars in 2005 PPP dollars, or approximately \$197 billion in 2010.

That is, **if the incomes of every extremely poor person were to rise to the \$1.25 line, the aggregate increase in their income would need to total at least \$169 billion dollars in 2005 PPP terms. We call this number the aggregate extreme poverty gap. This represents approximately 0.25 percent of global GDP.** It is important to note that extreme poverty gap is the conceptual amount of direct additional income an average extremely poor person would need to get to \$1.25 per day and is not indicative of the level of assistance required to close the gap.

The aggregate global extreme poverty gap in 2010 was less than half the gap in 1981 (\$362 billion in 2005 PPP terms), a faster reduction than the reduction in the number of poor.
